

EXPERIMENT 3

Name- Soham Satpute

Class-D20A

Roll no-53

Aim: Create a Cryptocurrency using Python and perform mining in the Blockchain created.

Theory:

1. Blockchain Overview

A blockchain is a distributed, decentralized digital ledger used to record transactions securely across multiple computers (nodes). Instead of relying on a central authority, every node in the network maintains its own copy of the blockchain.

Each block in the blockchain contains:

- A list of transactions
- A timestamp
- The hash of the previous block
- Its own cryptographic hash

The blocks are linked together using hashes, forming a chain. Any attempt to modify data in a block changes its hash, which breaks the chain and makes tampering easily detectable. This property ensures data integrity, transparency, and immutability.

2. Mining

Mining is the process by which new blocks are added to the blockchain. It involves:

- Collecting pending transactions
- Creating a block header
- Solving a computationally difficult problem known as Proof-of-Work (PoW)

In Proof-of-Work, miners repeatedly change a nonce value to generate a hash that satisfies the network's difficulty requirement (such as leading zeroes). Once a valid hash is found, the block is added to the blockchain and shared with other nodes. As an incentive, miners receive a cryptocurrency reward for their computational effort.

3. Multi-Node Blockchain Network

In this experiment, a multi-node blockchain network is simulated using three nodes running on different ports (5001, 5002, and 5003).

Each node:

- Operates independently
- Maintains its own copy of the blockchain
- Communicates with peer nodes to share newly mined blocks

This setup demonstrates how blockchain achieves decentralization and synchronization without a central server.

4. Consensus Mechanism

To ensure consistency across all nodes, the Longest Chain Rule is used as the consensus mechanism.

When different versions of the blockchain exist, the node accepts the longest valid chain as the correct one. This rule ensures that all nodes eventually agree on a single transaction history, even if temporary differences arise.

5. Transactions and Mining Reward

Transactions in the cryptocurrency system include:

- Sender address
- Receiver address
- Transaction amount

When a block is mined, all pending transactions are added to the block. Additionally, a special transaction is created to reward the miner with newly generated cryptocurrency. This reward mechanism motivates miners to maintain and secure the network.

6. Chain Replacement

The chain replacement process ensures network consistency. When the `/replace_chain` endpoint is triggered:

- A node requests blockchain data from its peers
- Validates the received chains
- Replaces its own chain if a longer and valid chain is found.

This mechanism helps resolve conflicts and keeps all nodes synchronized.

Output:

1)/get_chain

This GET request retrieves the complete blockchain from the node, showing all mined blocks and stored transactions.

The screenshot shows a web browser interface for an HTTP client. The address bar displays the URL `http://127.0.0.1:5001/get_chain`. The request method is set to `GET`. Below the address bar, there are tabs for `Params`, `Authorization`, `Headers (6)`, `Body`, `Scripts`, and `Settings`. The `Query Params` section is empty, showing a table with columns `Key`, `Value`, and `Description`.

The response section shows a status of `200 OK` with a response time of `8 m`. The response body is displayed in JSON format, showing a list of blockchain blocks and transactions. The JSON structure is as follows:

```
{
  "timestamp": "2026-02-12 21:05:08.065576",
  "transactions": [],
},
{
  "index": 2,
  "previous_hash": "a332d5856881c0d6b23c5079e510e7cf6ed6b7eb6763d1e6d373fe8bb5233ce3",
  "proof": 533,
  "timestamp": "2026-02-12 22:53:23.403173",
  "transactions": [
    {
      "amount": 50,
      "receiver": "Alice",
      "sender": "Soham"
    },
    {
      "amount": 1,
      "receiver": "Soham",
      "sender": "864f22652521415997b4c1e100cd2766"
    }
  ]
}
```

2)/mine_block

This GET request performs the mining process using Proof-of-Work and adds a new block to the blockchain.

26   ]
27 }
```

3)/is_valid

This GET request checks whether the current blockchain is valid and untampered.

The screenshot shows a REST client interface with the URL `http://127.0.0.1:5001/is_valid`. The request method is `GET`. The response status is `200 OK` with a response time of 74 ms and a body size of 215 B. The response body is displayed in JSON format:

```
{  "message": "All good. The Blockchain is valid."}
```

The interface includes tabs for Params, Authorization, Headers (7), Body, Scripts, and Settings. The Params tab is active, showing a table with columns Key, Value, and Description.

4)/add_transaction

This POST request submits a new transaction (sender, receiver, amount) to be added to the next mined block.

The screenshot shows a REST client interface with the URL `http://127.0.0.1:5001/add_transaction`. The request method is `POST`. The response status is `201 CREATED` with a response time of 9 ms and a body size of 221 B. The response body is displayed in JSON format:

```
{  "message": "Transaction will be added to Block 3"}
```

The interface includes tabs for Params, Authorization, Headers (8), Body, Scripts, and Settings. The Params tab is active, showing a table with columns Key, Value, and Description.

5)/connect_node

This POST request connects the current node with other peer nodes in the blockchain network.

The screenshot displays a REST client interface with a tab for the endpoint `http://127.0.0.1:5001/connect_node`. The request is a POST method. The body is set to 'raw' and contains a JSON object with a list of nodes. The response is a 201 Created status, indicating a successful connection.

Request:

```
1 {
2   "nodes": [
3     "http://127.0.0.1:5002",
4     "http://127.0.0.1:5003"
5   ]
6 }
```

Response:

```
1 {
2   "message": "All nodes connected successfully!",
3   "total_nodes": [
4     "127.0.0.1:5003",
5     "127.0.0.1:5002"
6   ]
7 }
```

201 CREATED • 14 ms • 268 B

6)/replace_chain

This GET request checks all connected peer nodes and replaces the current blockchain with the longest valid chain, ensuring network-wide consistency.

The screenshot displays a REST client interface for the endpoint `http://127.0.0.1:5001/replace_chain`. The method is set to `GET`. The response status is `200 OK` with a response time of `48 ms` and a body size of `615 B`. The response is shown in JSON format, representing a blockchain with two blocks. The first block has an index of 1, a previous hash of `"0"`, a proof of 1, a timestamp of `"2026-02-12 21:05:08.065576"`, and no transactions. The second block has an index of 2, a previous hash of `"a332d5856881c0d6b23c5079e510e7cf6ed6b7eb6763d1e6d373fe8bb5233ce3"`, a proof of 533, a timestamp of `"2026-02-12 22:53:23.403173"`, and a single transaction with an amount of 50, receiver "Alice", and sender "Soham".

```
{
  "index": 1,
  "previous_hash": "0",
  "proof": 1,
  "timestamp": "2026-02-12 21:05:08.065576",
  "transactions": []
},
{
  "index": 2,
  "previous_hash": "a332d5856881c0d6b23c5079e510e7cf6ed6b7eb6763d1e6d373fe8bb5233ce3",
  "proof": 533,
  "timestamp": "2026-02-12 22:53:23.403173",
  "transactions": [
    {
      "amount": 50,
      "receiver": "Alice",
      "sender": "Soham"
    }
  ]
}
```

Conclusion:

In this experiment, a basic cryptocurrency system was designed and implemented using Python by applying fundamental blockchain principles such as block generation, cryptographic hashing, Proof-of-Work mining, transaction processing, and decentralized networking. A Flask-based framework was used to enable communication between multiple nodes, with each node maintaining its own copy of the blockchain ledger.

The mining process required solving the Proof-of-Work challenge, after which new blocks were added to the chain and miners received rewards. The system also supported transaction validation and inclusion of verified transactions into newly mined blocks. Through this implementation, the experiment offered hands-on insight into the functioning of blockchain technology, demonstrating how consensus, decentralization, and mining together enable the secure operation of cryptocurrencies in distributed environments.
